

7 sins of access risk management

- and how to avoid them
with automated control
to save your data

Ignorance is bliss, they say...When it comes to data security, it is a sin that can sabotage your business. Your awareness status can make or break your company's future. It's not only about security, it is also about cost-efficiency which can save you time and money.

What we'll cover to get you covered:

Part 1 - Be aware of potential risk factors: We list all the possible ways ignorance can harm your business and help you check your security status.

Part 2 - Defend what's yours: We show you how automated access control can maximize your security and boost productivity.

Part 1 – Be aware of potential risk factors

The biggest risk is always the one you're not aware of. Get prepared, and identify the 7 sins of access control management in your company.

You think it can't happen to you.

Fact: The greatest sin in access control management is ignorance and the lack of cyber security awareness. We all know Murphy's law: if anything can go wrong, it will eventually go wrong. It's only a matter of time. Especially in cyber security, where small mistakes can have serious consequences.

You think the problem is outside.

Fact: It's a common misconception that cyber threats mainly come from an external source. The truth is, even some phishing attacks could be traced back to unmanaged access risk issues. Most of the time, business data leakage comes from a company's inner circle.

You think it's about employee trust.

Fact: The road to hell is paved with good intentions. Every employee is a potential threat, not because of their bad intentions, but simply because of inevitable human error. The weakest link is never the employee, it's your cyber defense.

You give access rights manually.

Fact: You have no proper process to supervise the revoking of leaving employees' accounts and licenses. It is just beyond human capacity to supervise all employees and identify all potential risk factors. Especially with rising employee fluctuation. Manual tasks are the biggest cause for cyber threats.

You don't monitor license usage.

Fact: Inactive licenses can be a huge money drain for your business. Keep track of your software licenses and make sure that 1) current employees have only what they need and 2) former employees are fully out of your system.

You're scared of security audits.

Fact: Auditors can cause constant stomach cramps, especially if you work in an industry where you have to be compliant with IT security standards. Be prepared instead of being scared.

You don't know there's an easy way.

Fact: Automated access control can save you from all these sins. It's effortless and effective, easier than you think. It will save you data, money and time.

Bottom line: Most businesses commit these sins, but there's no forgiveness in the world of cyber-security. Once your data's out, you'll never have a second chance to get it back. Roughly 90% of data breaches occur on account of phishing - an external attack that could have been easily warded off with proper access risk management.

*That's why prevention is the best defense.
Defend what's yours and automate access control.
It's better to be safe than sorry.*

Check your current security status!

Part 2 - Automate the process, minimize error, maximize defense

Automated access control makes your cyber security routine effortless and effective. Empower your workforce for maximum security and productivity.

Automated risk detection:

Identify potential risk factors without relying on manual tasks or time-consuming training. It minimizes human error, the most common cause for business data leakage.

Automated notifications and alerts:

Prevent suspicious activities from turning into security threats. Reaction time is crucial, it can make a difference between an access risk and a cyber attack. Automated alerts help you address potential access risk issues as soon as possible.

Maximize transparency in your company:

Notifications and alerts are sent directly to your company's communication channels, so there's maximum awareness, nothing blocks the flow of information.

Clear instructions:

Immediate action can make or break your defense system, that's why we give you all the necessary information to take the right security measures at the right time.

Riskiest employees' report:

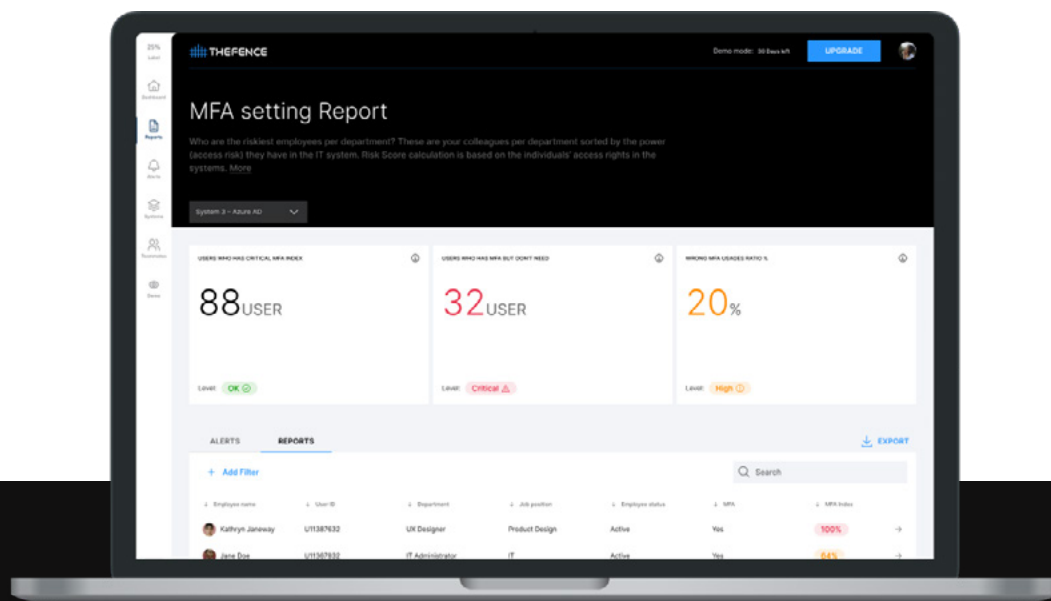

Stay always up-to-date and get a detailed overview of your employees' security status.

Boost productivity:

Customize control, set up specific alert triggers, so it is fine tuned for your needs, and integrates seamlessly into your workflow.

Save money:

By monitoring employee status and license usage you can save money by revoking unassigned licenses. You'll get a report of potential annual license cost savings. See it for yourself!
